<b>21.</b> When implementing linear regression of some dependent variable $y$ on the set of independent variables $\mathbf{x} = (x_1,, x_r)$ , where $r$ is the number of predictors, which of the following statements will be true?
a) $\beta_0$ , $\beta_1$ ,, $\beta_r$ are the regression coefficients.
b) Linear regression is about determining the best predicted weights by using the method of ordinary least squares.

c) E is the random interval

d) Both a and b

Sol: d) Both a and b

22. What indicates that you have a perfect fit in linear regression?

- a) The value  $R^2$  < 1, which corresponds to SSR = 0
- b) The value  $R^2 = 0$ , which corresponds to SSR = 1
- c) The value  $R^2 > 0$ , which corresponds to SSR = 1
- d) The value  $R^2 = 1$ , which corresponds to SSR = 0

**Sol**: d) The value  $R^2 = 1$ , which corresponds to SSR = 0

**23.** In simple linear regression, the value of what shows the point where the estimated regression line crosses the y axis?

- a) Y
- b) B0
- c) B1
- d) F

**Sol**: b) B0

<b>24.</b> Check out these four linear regression plots:
Which one represents an underfitted model?
a) The bottom-left plot
b) The top-right plot
c) The bottom-right plot
d) The top-left plot
Sol: d) The top-left plot
25. There are five basic steps when you're implementing linear regression:
• a. Check the results of model fitting to know whether the model is satisfactory.
• b. Provide data to work with, and eventually do appropriate transformations.
• c. Apply the model for predictions.
• d. Import the packages and classes that you need.
• e. Create a regression model and fit it with existing data.
However, those steps are currently listed in the wrong order. What's the correct order?
<b>Sol</b> : d) d, b, e, a, c
<b>26.</b> Which of the following are optional parameters to LinearRegression in scikit-learn?
a) Fit
b) fit_intercept
c) normalize
d) copy_X
e) n_jobs
f) reshape
Sol: a) Fit: it is a command in Linear Regression not a parameter
b) fit_intercept : determines whether to calculate the intercept of the linear regression model. If set

c) normalize: is used when working with data on different scales, it brings the data to the same scale.
d) copy_X: determines whether to copy the input data (features) before fitting the model. It is True by default, means a copy is made, but it can be set to False to avoid unnecessary data copying
e) n_jobs: is used to specify the number of cores of CPU to be used while fitting the model, by default it is 1, if set to -1 then use all available cores.
f) reshape: is not a parameter for LinearRegression in scikit-learn.
So, b), c), d) and e) are optional parameters.
<b>27.</b> While working with scikit-learn, in which type of regression do you need to transform the array of inputs to include nonlinear terms such as $x^2$ ?
a) Multiple linear regression
b) Simple linear regression
c) Polynomial regression
Sol: c) Polynomial regression
<b>28.</b> You should choose statsmodels over scikit-learn when:
a) You want graphical representations of your data.
a) You want graphical representations of your data.
a) You want graphical representations of your data. b) You're working with nonlinear terms.
<ul><li>a) You want graphical representations of your data.</li><li>b) You're working with nonlinear terms.</li><li>c) You need more detailed results.</li></ul>
<ul><li>a) You want graphical representations of your data.</li><li>b) You're working with nonlinear terms.</li><li>c) You need more detailed results.</li><li>d) You need to include optional parameters.</li></ul>
<ul><li>a) You want graphical representations of your data.</li><li>b) You're working with nonlinear terms.</li><li>c) You need more detailed results.</li><li>d) You need to include optional parameters.</li></ul>
a) You want graphical representations of your data. b) You're working with nonlinear terms. c) You need more detailed results. d) You need to include optional parameters.  Sol: c) You need more detailed results  29 is a fundamental package for scientific computing with Python. It offers comprehensive mathematical functions, random number generators, linear algebra routines, Fourier
a) You want graphical representations of your data. b) You're working with nonlinear terms. c) You need more detailed results. d) You need to include optional parameters.  Sol: c) You need more detailed results  29 is a fundamental package for scientific computing with Python. It offers comprehensive mathematical functions, random number generators, linear algebra routines, Fourier transforms, and more. It provides a high-level syntax that makes it accessible and productive
a) You want graphical representations of your data. b) You're working with nonlinear terms. c) You need more detailed results. d) You need to include optional parameters.  Sol: c) You need more detailed results  29 is a fundamental package for scientific computing with Python. It offers comprehensive mathematical functions, random number generators, linear algebra routines, Fourier transforms, and more. It provides a high-level syntax that makes it accessible and productive a) Pandas
a) You want graphical representations of your data. b) You're working with nonlinear terms. c) You need more detailed results. d) You need to include optional parameters.  Sol: c) You need more detailed results  29 is a fundamental package for scientific computing with Python. It offers comprehensive mathematical functions, random number generators, linear algebra routines, Fourier transforms, and more. It provides a high-level syntax that makes it accessible and productive a) Pandas b) Numpy

30. \_\_\_\_\_\_ is a Python data visualization library based on Matplotlib. It provides a high-level interface for drawing attractive and informative statistical graphics that allow you to explore and understand your data. It integrates closely with pandas data structures.

a) Bokeh
b) Seaborn
c) Matplotlib
d) Dash

**Sol**: b) Seaborn
